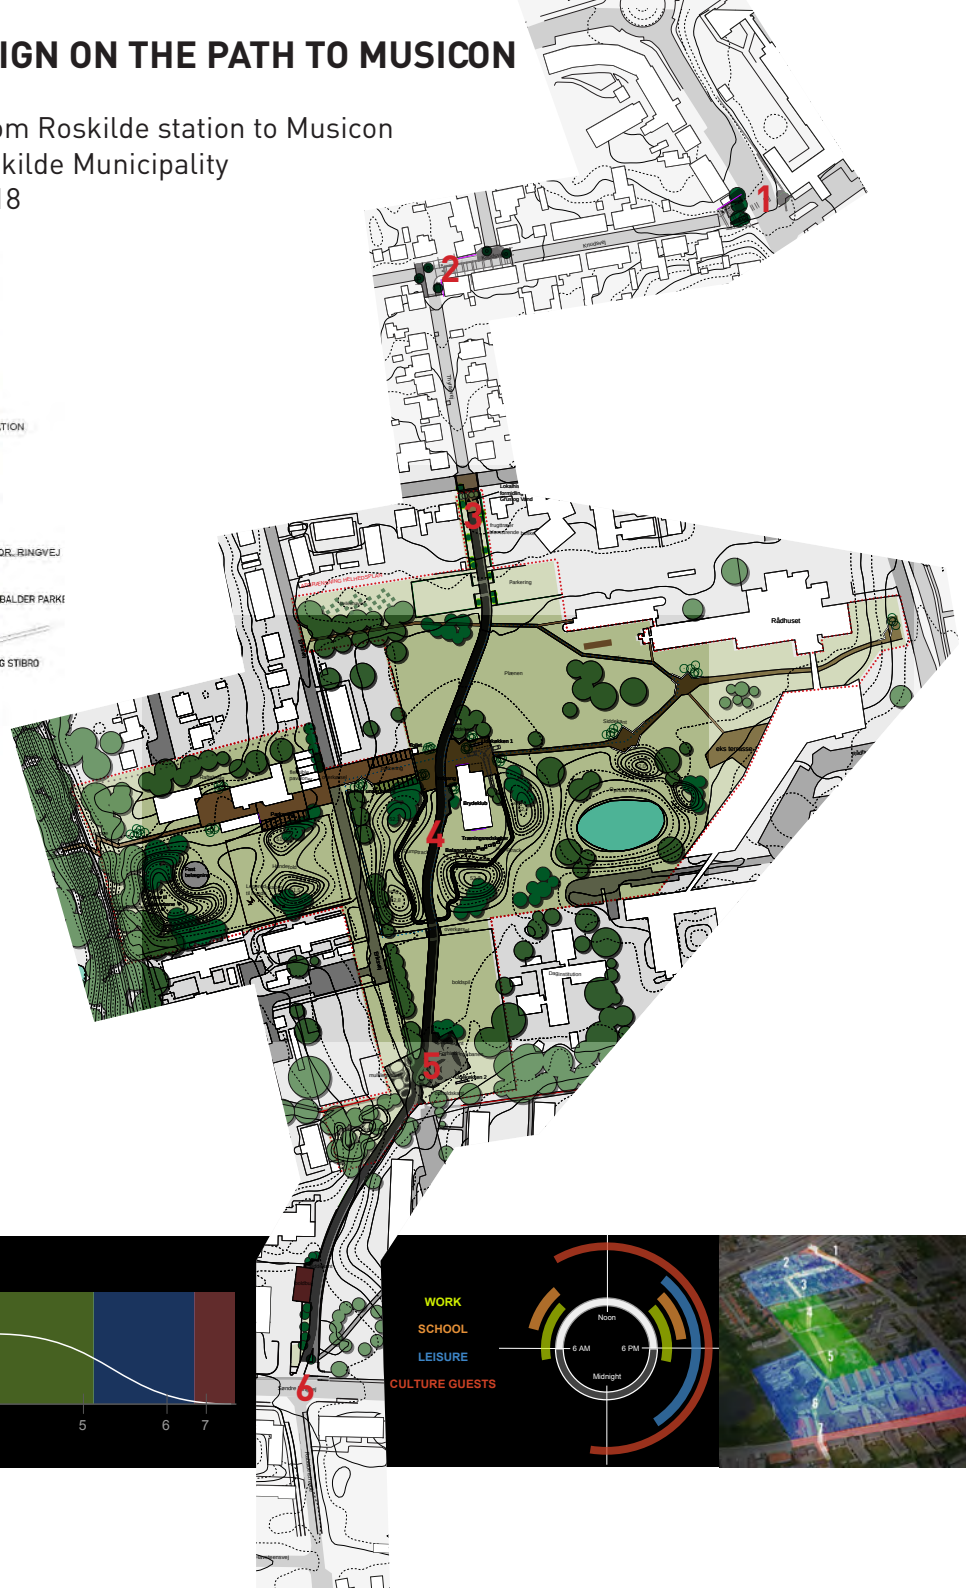
LIGHTING DESIGN ON THE PATH TO MUSICON

Site: 1 km route from Roskilde station to Musicon
Project owner: Roskilde Municipality
Realisation: 2017-18



The Musicon path

The path is being created as part of the urban development of Musicon to make a better and more attractive connection between Musicon and the station and city center.
The vision of Musicon is to create a creative urban area with companies, culture, education, shopping and housing. Important elements in the strategy are events, temporality, events and co-creation with the users. To make the route most interesting and active there will - along the path - be build a pump track, a playground for cyclists and a court for ball games.

The lighting design

The lighting design will focus on 3 different target groups by adressing these groups in 6 different spots on the route.
Using interactive lighting and working with 'flow' and 'water' as the overall theme, the design must aim to:

- make the path interesting to move along on everyday basis on the way to work or education (daily users/ spot 2, 3 and 5/ indirect interaction responding to time and season)
- motivate to spend time on the pump track on the way to leisure acitivities (frequent users on wheels/ spot 4/ direct interaction responding to movement)
- work as clear way finding on the way to events (cultural guests/ spot 1 and 6/ indirect interaction responding to a calender announcing events)

All together the lighting design will be used as a living lab investigating the interaction between lighting and users.

The triple helix partnership

The lighting project is being developed in collaboration between the municipality, Dong Energy and Aalborg University Copenhagen formalised through an OPI-agreement. The partnership intends to involve more partners related to lighting design/ engineering and visual art/ graphic design.
